

Game project

Extensions

To match with my game project, my background music is taken from the cartoon (Doraemon) itself. This makes the game more interesting as I find myself immersed in a symphony of familiar tunes, complementing the charm of the original cartoon series.

Moreover, platforms are created to make the game more challenging by putting the collectable items (dorayaki) on the platforms. The character has to jump onto these platforms to collect the dorayaki, adding slight challenge and verticality to the level design.

As the character Doraemon fears mice, I have created a few enemies resembling mice in the game world using a constructor function. The player will need to avoid touching the mice in order to collect the dorayaki and win the game.

Bits I found difficult

One part of the project that I found it difficult was debugging the jump mechanic after adding in certain functions such as falling down the canyon and collision with platforms. These changes in the code would affect the whole jump mechanic. As a result, whenever such a function involving jumping was added, I had to test and amend the code a few times to reach my goals.

Skills I learnt

In a nutshell, the project has been an exceptional introduction to programming. With no prior experience, this project has opened my eyes to concepts I would never have thought about when writing code for a video game such as adding new code and mechanics then end up affecting mechanics added very early on in the project. Overall, I had an enjoyable time experimenting with this game project and learnt about debugging, organisation of code, factory and constructive functions and adding music to a program using a separate asset folder.
